PRO-C101: ROLL-A-DICE Completed

In This Project, You Will Use Another Built-In Module 'Random' To Create A Class Dice Simulator.

Goal of the Project:

In Class 101, you learned to create programs using built-in module time.

In this project, you will use another built-in module "random" to create a class dice simulator.

Story:

Your friends have gathered at your place after a long time to spend some fun time. You all decide to play a board game. But you are unable to find a dice. You quickly use your coding skills to create a dice simulator and enjoy the board game with your friends.

```

[0  0]
[  0 ]
[0  0]
[-----]
press y to roll again and n to exit:█
```

*This is just for your reference. We expect you to apply your own creativity to the project.

Getting Started:

1. Create a new folder named **Project101**.
2. Open the folder in VSC.
3. Create a new file named **roll-a-dice.py**.

Specific Tasks to complete the Project:

1. Dice shows a random number every time the dice is rolled. You can therefore use the **random** built-in module from Python.
2. First **import random** in the file.
3. The code will ask the user if they want to roll a dice or not?
4. Initially, we will set response to Yes, initialize a variable **response** to a str "y".
5. Use a while loop to run till **response == "y"**
6. The **random** module has a method **randint()**.
 - o The syntax is **randint(start, end)**

Ask a doubt to your teacher

HELP

- It returns a random integer in the range [start, end] including the endpoints.

For creating a dice we need a random number between 1 and 6

```
no = random.randint(1,6)
```

7. Use the if condition to check the value of **no**, to **print()** the out

8. Create multiple **print()** to represent a dice. (See Hint 1)

9. After each output, prompt a user to enter **"y"** to continue and **"n"** to exit.

10. Assign user input to the variable **response**.

11. The while loop will run until the user keeps entering **"y"** when the response = **"n"** the code should exit the loop and stop the program.

12. Run the code using Terminal.

- Run the file using python **Roll-a-Dice.py** / **py Roll-a-Dice.py**

```
PROBLEMS  OUTPUT  TERMINAL  DEBUG CONSOLE

PS C:\WhiteHatJr\Python\101Project> py Roll-a-Dice.py
[-----]
[0  0]
[ 0 ]
[0  0]
[-----]
press y to roll again and n to exit:
```

Submitting the Project:

1. **SAVE** all the changes made to the project.
2. Click on **"Run"** once to check if it is working.
3. Open the GitHub create a repository named **Project101**
4. Upload a file **Roll-a-Dice.py** and click **Commit Changes**
5. Copy this link and submit it in the Student Dashboard Projects panel against the correct class number.

Hints:

1. Use a multiple **print()** statement to create a Dice to show one 0 if **no==1**.

```
if no == 1:
    print("[-----]")
    print("[    ]")
    print("[ 0  ]")
    print("[    ]")
    print("[-----]")
```

- Create other if conditions similarly.
